PROJECT REVIEW -2

TITLE : Intelligent Disaster Data Interoperability and Emergency Response Coordination Platform

BY TEAM

SALVA SOUMYA , 23MID0061

GILLEDI SANTHOSH , 23MID023

UNDER THE GUIDANCE OF

Dr.SHARMILA BANU K

Member 1: Disaster Data Integration and Emergency Response Coordination System (23MID0061)

Member 2 : Intelligent Disaster Assessment and Resource Management System (23MID0233)

Speaker 00:00
Good evening ma'am, this is G Santosh. So our project title is Disaster Data Integration and Intelligent Disaster Assessment System. The main aim of our project is to collect disaster related information and how it in our website.

Speaker 00:17
During disasters, a lot of information is available but it can be difficult to check everything separately. So our project helps users to see and understand this information in one place. Now our project has two main parts. The first part collects the information and process the disaster data.

Speaker 00:36
The second part uses the data to understand the disaster situation and show useful information on the website. Now, I will explain the main use of our project. Our website can be useful for disaster management teams

Speaker 00:54
emergency workers, shelter managers and people who help the rescue and relief activities. First, member 1 collects the process and disaster data set. After processing the data, it is sent to member 2's module through an API connection. Member 2's module receives the data using

Speaker 01:16
and uses it to display required information in our website. Our website has different pages and each page has different purpose. First, we have the dashboard which gives an overall view of disaster information. Next, the incident assessment page shows detailed about the disaster such as type of incident and its locations and mainly number of people affected based on the available data.

Speaker 01:45
The Shelters page shows information about shelters and their capacity. The Resources page helps users check available supplies and identifies where more resources may be needed. The Analytics page helps users

Speaker 02:01
understand the data through charts and other visual information. Finally, the recommendation page provides suggestions that can help users to plan their next steps during the disaster. In this way, our websites make disaster related information easier and access and easy to understand. Now coming to the technologies we use in our project.

Speaker 02:23
For the frontend we use React and Vite. These technologies helps us to create the website and its different pages. For the backend we use python and fastapi. The backend receives the data, handles the data requests and sends the required information to the frontend. We use also a pandas to read and process the data sets like csv files. We also use API connections

Speaker 02:53
API connections to connect the two modules. Currently both backends are running in separate laptops during development. So,

Speaker 03:02
We also use a Cloudflare tunnel to make API connection between them possible. These member 1 modules send the processed data to member 2's module even though they are running on different laptops. So finally our project brings disaster related information together in one website and it helps users to check incident details, view shelter and resource information.

Speaker 03:29
understand the available data to get suggestions for disaster response planning. So the main goal is to make disaster information easy to access and help people to make better decisions during emergency situations. Thank you.
